                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 70 Application PC/TUS9502772

Varietic 17 Application PC/TUS9502772

Varietic 17 Protein Polymer Technologies, Inc.

TITLE OF IMPRETURE: Synthetic Proteins As Implantables

NUMBER OF SEQUENCES: 9
OPERAIING SYSTEM: Pc-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DAIA:
                                                                                                                                                                         CORRECT PRILACATION WATER
TELLEG DATE: IL MAR-1994
CLASSITICATION: 435
AUTORREVA ASSET INVAR-1994
CLASSITICATION: 435
AUTORREVA ASSET INVAR-1994
AUTORREVA ASSET INVAR-1994
NUMBER: ROWLAND BETTERN IN
REDESPOND: 415-781-1999
INVORMATION FOR SED ID NO: 7:
FELEPRONE: 415-781-1999
INVORMATION FOR SED ID NO: 7:
SEGURACE CHARACTRESTICS:
LENGTH: 972 amino acids
TYPE: maino acids
TYPE: maino acids
TYPE: maino acids
STRANDENESS: single
TOPPLOGY: 11 INDAR-1994
NOLECULE IFFE: protein

This represents the non natural minimal functional unit (NFU)-2

CO polygeptide which comprises tandem repeats of a portion of the NFU-1

CO polygeptide of the invention. The MFU is a polygeptide that has at least

CO beta-sinearly beta-turn structures, but is not a naturally occurring act

fibrous protein. Book beta-sinear structure has 3-7 (preferably 5-7) anic

co acids and the MFU polypeptide may include at least I amino acid that can

take part in crosslinking. The polypeptide can also be derived from the

sequences of animal leastin, lamptin and spider silk procen. The MFU

CO polypeptides are self-silkinging peptides having the same primary structure

as part of a natural fibrous protein. They are used to coat prosthesses

CO made of animal or synthetic material or metal, particularly for use as

CO properties are self-silkinging peptides having the same primary structure

as part of a natural fibrous protein. They are used to coat prosthesses

CO made of animal or synthetic material or metal, particularly for use as

CO stents. They can be used in cosmetic. alsatic or high-tensile strength

contains and are easier to manipulate and produce than the NEU

contains and are easier to manipulate and produce than thil-length

alastins. They are non-thromogenic and non-immunogenic. Materials can

anterial and and are easier to manipulate and produce than thill-length

alastins. They are non-thromogenic and non-immunogenic. Materials can

the made firm of alastin and the high tensile strength of spider silk

contains the produce of particular applications, et al. combining the high

contains the produce than the contains the produce than the contains and the high tensile strength of spider silk

```
The invention relates to a derivative or variant of human tropelastin (hTF) having elastin—its and/or macromolecule (specifical) by degree along elastin-its and/or macromolecule (specifical) by degree and of a specifical properties. Colis containing vectors comprising the nucleia coids and encoding the variants or derivatives are used to produce the proteins recombinantly. The tropolastin derivatives or hybrid proteins containing the derivatives are useful in medical, vertainary and cosmetic applications, e.g. as and industrial products. The hybrid protein have controllable Gad-binding properties, depending on presence or absence of a specific fragment, designated human tropoclastin variant SHEGGelta26A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Tropoelastin; derivative; SHEL-delta-26a; SHEL; proteolysis; protease; senivrinkle; hand lotton; bulking agent; ohemozatis; proliferation, growth inhibition; peptidomimetic; lung damage; elastin; cancen;

Human tropoelastin derivative SHELdeltamodified.

07-JUN-1999 (first entry)

Y01303;

Y01303 standard; Protein; 660 AA.

```
The present sequence represents a human reduced tropoelastin derivative, confessionated STBZ-Cella-256. The sequence is produced by removing casing and STBZ-Cella-256. The sequence is produced by removing cascs of STBZ-Cella-256. The sequence is produced by removing cascs of STBZ-Cella-256. The sequence is representative of contropolating derivatives of the invention, in which a subsequence has been mixted so that susceptibility to proteolysis is reduced or a subsequence has been inserted so that susceptibility of the proteolysis is reduced or a susceptibility and can be used where the wild-type protein would be associately contropolating on the competitive inhibition of protein contropolating derivatives, and other polypetides containing tropoelastin derivative-derived protease-susceptibility sites, are useful to thoman or veterinary medicine, conseniors (e.g. antivitività or hand contropolating agents and for inducing chemotaxis. They are also contrologistic cells, epithalial or endothelial cells, fibrioblasts, osteocytes, conductoring and set used for proteolastic har minic the protease or cleavage site in tropoelastin derivatives are competitive inhibitors or controlling localized giantly in dange caused by metastases, and are used for protease accurating recombining controlling localized proteins or controlling localized giantly that causes blood clotting.

Metastases, or to limit protease activity that causes blood clotting.
                                                                                                                                                                                                                                                                                                                                                                                                                 New derivatives of tropoelastin useful, e.g. for inducing chemotaxis and cell growth - \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; Page 110-112; 136pp; English.

The invention relates to a derivative or variant of human tropoelastin (MTS) having elastin-like and/or mecroachecute (specifical) adjoorsalmodyjvan (G46))-binding properties. Cells conclainty vectors comprising the nuclear acids emodang the variants or derivatives are to produce the proteins recombinantly. The tropoelastin derivatives for physic droteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as anti-viriable or hand lottons, also as surgicial implants, foods and industrial products. The hybrid protein have controllable GAG-binding properties, despending on presence or absence of a specific fragment, designated tropoelastin derivative SHEIAclatonodified. propoelastin, hTB; elastin; glycosaninoglycan; GAC-binding; medical; plamaceutical; vecerinary; cosmette application; anti-wrinkle; food; hand locton; surgical implant; industrial product; human; STE1. Peptides derived to elastin are used in compositions of the invention. The specification describes elastin based compositions that are potent sequence of smooth muscle call profileration, differentiation and migration in vivo. The elastin based compositions comprise at least one alastic fibre, elastins, tropoelastins (or fragments of them) which have biological activities comprising inhibiting the proliferation of smooth muscle cell in vivo, and regulating the majoration of smooth muscle cell in vivo, and regulating the majoration of smooth muscle cell in vivo, the compositions may be used for the prophylaxis or treatment of a disorder characterized by diamished capacity to regulate smooth cancel are successively and the composition such as altherosclerois restenois, vascular configuration. Disorders which may be treated also include swas (undefined), hypertension, and transplant erteriopathy, aneurysm and/or hypertension, and transplant erteriopathy.

The protein is used in compositions of the invention. The specification describes elastin based compositions that are porent regulators of smooth muscle ceil proliferation, differentiation and migration in vivo. The elastin-based compositions comperise at least one elastic fibre, elastins, tropocalastins (or fragments of them) which have biological activities compositions inhibiting the proliferation of smooth muscle cells in vivo; stimulating the differentiation of smooth muscle cells in vivo; stimulating the differentiation of smooth muscle cell in vivo; and regulating the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Tropoelastin; elastin; elastic fibre; smooth muscle cell proliferation; smooth muscle cell differentiation; smooth muscle cell migration; smooth muscle cell function; atheroscalerosis; restenosis; aneurysm; vascular bypass graft stenosis; transplant arteriopathy; dissection; SVAS; hypertension; transplant arteriopathy.

8
nigration of smooth muscle cells in vivo. The compositions may be used for the prophylaxis or treatment of a disorder characterized by diminished capacity to requiate smooth muscle cell function such as atherosclerosis, restenosis, vascular bypass graft stenosis, transplant atteriopathy, amenuysm and/or dissection. Disorders which may be treated also include 87Ms (undefined), hypertension, and transplant arteriopathy.
                                                                                                                                                                                                                                                                                                        61 AAAKAAQF -----GLVBGVGVAPGVGVAPGVGVAPGVGCAAGGVGVAPGVGVAP 114

This represents the human elastin sequence containing the minimal thritical unit (MTO): 1 polypeptice of the invention. This MTO: 1 is a copyreptice that has at least 3 beta-sheety beta-turn structures, but to polypeptice that has at least 3 beta-sheety beta-turn structures, but as 1-7 (preferably 5-7) amino acids and the MTO polypeptide may include the as 3-7 (preferably 5-7) amino acids and the MTO polypeptide may include to a least 1 amino acid that cen take part in crosslinking. The polypeptide can also be derived from the sequences of animal elastin, lamprin and soften she per search that structure as part of a natural fibrous protein. They are used to cost proctheses andeo of aminal or synthetic material or metal, particularly focus as blood vessel or heart valve replacements. Or metal, particularly focus as blood vessel or heart valve replacements. Or ental, particularly focus as blood vessel or heart valve replacements. Or ental, particularly strength materials, e.g. ropes or parchute cord. Calastic or high-tensile strength materials, e.g. ropes or parchute cord. Cortices as beased on the MTO allow penetration of endochabilal cells, so become permanent, living, tissue replacements. The MTO pulpaptides have been an electra biocompatibility than know allattin-based materials. They are non-throodenic and poroluce of whaterials can be made from 2 or more different MTO polypeptides to allow the profession of the high tensile strength of spider containing the six protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8,

                                                                                                                                                                                                                                                                                                    The present sequence represents a human tropoelastin splice form. The present sequence represents a human tropoelastin splice form. The specification describes tropolastin derivatives, in which a subsequence has been inserted so that susceptibility to proteolysis is reduced or a subsequence has been inserted so that susceptibility.

To proteolysis is increased. The derivatives have with reduced considerably and can be used where the wild type protein would be degraded too easily, e.g. in contact with serum or wound extract the contact with serum or veterinary medicine, consents (e.g. antivitally of smooth. The mascine calls, epithalial or endothalial cells, fibroblasts osteocytes, of conduccytes and platelers repriadminents that minist the protease and controlling derivatives are competitive inhibitors of cleavage site in tropoelastin derivatives are competitive inhibitors of cleavage site in tropoelastin derivatives are competitive inhibitors of the protease, and are used for protease and platelers. Periodminaries of anothers or elastin, for inhibiting or controlling localized growth of cancers or metastases, or to limit protease activity that causes blood clotting.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8

                                                                                                                                                                                                                                                                                                                                                                          The invantion relates to a derivative or variant of human tropoelsstin (hTE) having elastin-like and/or macronolcoile (specifical) by adjugged elastin-like and/or macronolcoile (specifical) by adjugged and adjugged (asjugged elasting the nucleic oxide encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelsstin derivatives or hybrid proteins containing the derivatives are useful in medical, which or hand locitons, also as surgicial implants, foods and indicating products. The hybrid protein have controllable GAC-binding properties, depending on present or absence of a specific fragment, designated sequence of the synthetic human tropoelsstin SHEL.

The present sequence represents: a human tropoelastin derivative, which is representative of tropoelastin derivatives of the invention. In the tropoelastin derivatives of the invention. In the tropoelastin derivatives of the invention. In the tropoelastin derivatives of the invention a subsequence has been contacted or eliminated.

The subsequence has been lasered for that susceptibility to protectives the with reduced susceptibility, and can be used where the wild-type protein would be degraded too easily.

The used where the wild-type protein would be degraded too easily.

The post of in contact with serving a would be degraded too easily.

The carrivatives provide competitive inhibition of protease activity. The derivative protein derivative is and other polypepticles containing tropoelastin derivative-dearived protease-usceptibility sites, are useful in human con veterinary medicion, commercis (e.g. antivitable or hand loions), as continged for inhibition or particularly of smooth muscle cells, epithelial, or endothelial cells, fibrichlasts, osteocytes, chondrocytes, contacting are used for protease are competitive inhibitions of the protease contacting against lung dange caused by elastin for the limit protease activity that causes blood clotting.
                                                                                                                                                                                                                                                                                                                                                                                                                                     New derivatives of tropoelastin useful, e.g. for inducing chemotaxis and cell growth - \,

The present sequence represents novel alanine-containing polymer IV chat has bloedastic properties. The invarious provides a mached of tissue augmentation by injecting a polymer computation provides a method of tissue augmentation by injecting a polymer computating repeating to peptide monomaric units selected from nonspeptide, pentapeptide and terrapeptide amorpment on tits, where the nonomaric units form a series of beta-turns separated by dynamic bridging segments. The polymer has an inverse temperature transition value (IT) that is less than the tissue temperature, and is injected in water solution at coaccurve concentration. The polymer is injected at periurethral or subdermal sites (for treatment of urinary incontinence or for cosmetic purposes) or into hard or soft tissue, as 4, for repair of treatment injury. A specific application is restoration of interversebral discs. Polymer IV has a TY value of 28 deg. Augmentation or restoration of mammalian its wee by injecting solution of peptide polymer, used for soft or hard tissue reconstruction, especially of intervertebral disks Riastomer: bloelastomer; polymer IV; tissue augmentation; tissue restoration; tissue reconstruction; tissue repair; implant; fibromectin cell attachment site. Alanine-containing elastomer, polymer IV. Claim 73; Page 106-109; 133pp; English. Glazer PA, Parker TM, Urry DW;

cDNA fragment encoding tropoelastin - has inhibiting activity towards platelet aggregation and is useful for prophylaxis of arteriosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The cDNA was sequenced from a clone prepd. from mRNA isolated from thicken acrte tissue. It can be used to produce tropoelastin which is a precursor of elastin which does not have desmosine, isodesmosine and lysynovlleusine residues and isn't crossliked.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents the monomeric unit of a novel alandment orderabiling polymer (see 73162) that has bloelbastic properties. The invention provides a method of tissue augmentation by injecting a polymer comprising repeating peciale unomeric units selected from nonapeptide, pentapeptide and tetrahelic monomeric units solored from nonapeptide, pentapeptide and tetrahelic monomeric units solored from nonapeptide, pentapeptide and tetrahelic monomeric units solore a crise of beta-turns separated by dynamic bridging segments. The polymer has no inverse temperature transition value that is less polymer than the tissue temperature, and is injected in water solution at consentration. The polymer is injected at perturehral consumration is little for unit properties. The cosmetic purposes, or into hard or soft tissue, e.g. for regain of transvertence of for transvertence in the properties of the publication is restoration of transvertence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Querry Match 4.8%; Score 455.5; DB 20; Length 148; Best Local Similarity 56.4%; Pred.                                                              Ablate precursor, splice form a - boyine

W. Alternate names, troposlastin

W. Ontatans: elastin precursor, splice form b; elastin precursor, splice form c

C. Species: 30s printgenius taurus (cattle)

C. Species: 30s printgenius taurus (cattle)

C. Date: 08-Jun.1999

C. Corression: Al1865, A86728, P26728, A22343; 14586

C. March A. Anderson: W.: Ornstein-Goldstein, N.; Bashir, M.W.; Rosenbloom, J.C.; Abra

Biochemistry 28, 2365-2370, 1989

A. Titles: Structure of the boyine elastin gene and SI nuclease analysis of alternative

A. Recession: Al1865; WUID: 89274159

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                        US-09-340-736-2
